# **An Implementation**

# Construction

- $\bullet f_k(x) \coloneqq ?$
- Key schedule?
- $\square \mathcal{O}(n)$  rounds?

# Theoretical vs. practical constructions

# **Generic Analysis** On the number of rounds

# Observation

The ciphertext is the plaintext plus a subset of the round keys:

$$y = x + \sum_{i=1}^{r} \lambda_i k_i$$

For pairs 
$$x_i, y_i$$
: span  $\{x_i + y_i\} \subseteq \text{span}\{k_j\}$ .

$$y = x + \sum_{i=1}^r \lambda_i k_i$$

For pairs 
$$x_i, y_i$$
: span  $\{x_i + y_i\} \subseteq \text{span}\{k_j\}$ .

# Distinguishing Attack for r < n rounds

There is an  $u \in \mathbb{F}_2^n \setminus \{0\}$ , s.t.  $\langle u, x \rangle = \langle u, y \rangle$ holds always:

$$\langle u, y \rangle = \left\langle u, x + \sum \lambda_i k_i \right\rangle$$
  
=  $\langle u, x \rangle + \left\langle u, \sum \lambda_i k_i \right\rangle = \langle u, x \rangle + 0$ 

for all  $u \in \text{span} \{k_1, \dots, k_r\}^{\perp} \neq \{0\}$

=  $\langle u, x \rangle + \left\langle u, \sum \lambda_i k_i \right\rangle = \langle u, x \rangle + 0$ 

for all  $u \in \operatorname{span} \{k_1, \dots, k_r\}^{\perp} \neq \{0\}$ 

## Rationale 1

Any instance must iterate at least n rounds; any set of n consecutive keys should be linearly indp.

# A bit out of the blue sky, but:

## Rationale 2

For any instance,  $f_k$  has to depend on all bits, and for any  $\delta \in \mathbb{F}_2^n$ :  $\Pr[f_k(x) = f_k(x + \delta)] \approx \frac{1}{2}$ .

# A genus of the WSN family: BISON

## Rationale 1

Any instance must iterate at least n rounds; any set of n consecutive keys should be linearly indp.

# Rationale 2

For any instance,  $f_k$  has to depend on all bits, and for any  $\delta \in \mathbb{F}_2^n$ :  $\Pr[f_k(x) = f_k(x + \delta)] \approx \frac{1}{2}$ .

# Generic properties of Bent whitened Swap Or Not

- At least n iterations of the round function
- Consecutive round keys linearly independent

The round function depends on all bits  $\forall \delta$ :  $\Pr[f_k(x) = f_k(x + \delta)] = \frac{1}{2}$  (bent)

# A genus of the WSN family: BISON

## Rationale 1

Any instance must iterate at least n rounds; any set of n consecutive keys should be linearly indp.

# Rationale 2

For any instance,  $f_k$  has to depend on all bits, and for any  $\delta \in \mathbb{F}_2^n$ :  $\Pr[f_k(x) = f_k(x + \delta)] \approx \frac{1}{2}$ .

# Generic properties of Bent whitened Swap Or Not

- At least *n* iterations of the round function
- Consecutive round keys linearly independent

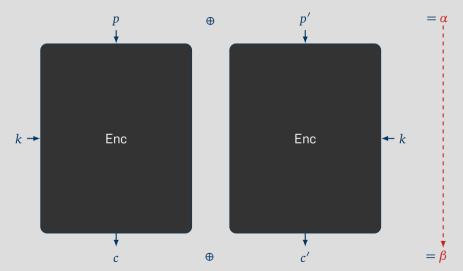

The round function depends on all bits  $\forall \delta$ :  $\Pr[f_k(x) = f_k(x + \delta)] = \frac{1}{2}$  (bent)

# Rational 1 & 2: WSN is *slow* in practice!

But what about Differential Cryptanalysis?

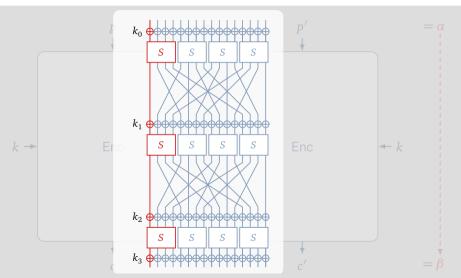

# Differential Cryptanalysis Primer

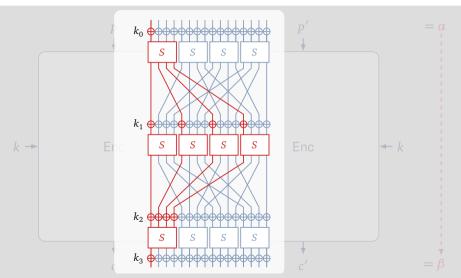

Friedrich Wiemer | BISON Instantiating the Whitened Swap-Or-Not Construction | September 6th, 2018

# Differential Cryptanalysis Primer

Friedrich Wiemer | BISON Instantiating the Whitened Swap-Or-Not Construction | September 6th, 2018

# Differential Cryptanalysis Primer

Friedrich Wiemer | BISON Instantiating the Whitened Swap-Or-Not Construction | September 6th, 2018

# Differential Cryptanalysis

# Proposition

For one round of BISON the probabilities are:

$$\Pr[\alpha \to \beta] = \begin{cases} 1 & \text{if } \alpha = \beta = k \text{ or } \alpha = \beta = 0\\ \frac{1}{2} & \text{else if } \beta \in \{\alpha, \alpha + k\}\\ 0 & \text{else} \end{cases}$$

Friedrich Wiemer | BISON Instantiating the Whitened Swap-Or-Not Construction | September 6th, 2018

# Differential Cryptanalysis

# Proposition

For one round of BISON the probabilities are:

$$\Pr[\alpha \to \beta] = \begin{cases} 1 & \text{if } \alpha = \beta = k \text{ or } \alpha = \beta = 0\\ \frac{1}{2} & \text{else if } \beta \in \{\alpha, \alpha + k\}\\ 0 & \text{else} \end{cases}$$

Possible differences

x	$+ f_k$	$(x)$ $\cdot k$	2
$\oplus x$ -	$\vdash \alpha$	$+ f_k(x + \alpha) \cdot k$	2
=	$\alpha + (f_k)$	$(x) + f_k(x+\alpha)) \cdot k$	2

# Differential Cryptanalysis

# Proposition

For one round of BISON the probabilities are:

$$\Pr[\alpha \to \beta] = \begin{cases} 1 & \text{if } \alpha = \beta = k \text{ or } \alpha = \beta = 0\\ \frac{1}{2} & \text{else if } \beta \in \{\alpha, \alpha + k\}\\ 0 & \text{else} \end{cases}$$

Possible differences

$$x + f_k(x) \cdot k$$
  

$$\oplus x + \alpha + f_k(x + \alpha) \cdot k$$
  

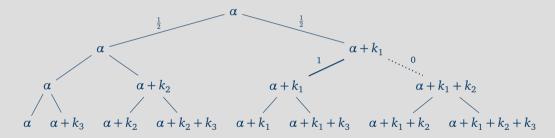

$$= \alpha + (f_k(x) + f_k(x + \alpha)) \cdot k$$

Remember  

$$\Pr[f_k(x) = f_k(x + \alpha)] = \frac{1}{2}$$

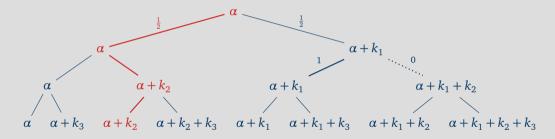

# Differential Cryptanalysis

# Differential Cryptanalysis

For fixed  $\alpha$  and  $\beta$  there is only *one* path!

# A concrete species

#### Friedrich Wiemer | BISON Instantiating the Whitened Swap-Or-Not Construction | September 6th, 2018

# Addressing Rationale 1 The Key Schedule

# Rationale 1

Any instance must iterate at least n rounds; any set of n consecutive keys should be linearly indp.

# **Design Decisions**

- Choose number of rounds as  $2 \cdot n$
- Round keys derived from the state of LFSRs
- Add round constants  $c_i$  to  $w_i$  round keys

## Implications

- Clocking an LFSR is cheap
- For an LFSR with irreducible feedback polynomial of degree n, every n consecutive states are linearly independent
- Round constants avoid structural weaknesses

# Addressing Rationale 2 The Round Function

# Rationale 2

For any instance, the  $f_k$  should depend on all bits, and for any  $\delta \in \mathbb{F}_2^n$ :  $\Pr[f_k(x) = f_k(x + \delta)] \approx \frac{1}{2}$ .

# **Design Decisions**

• Choose 
$$f_k : \mathbb{F}_2^n \to \mathbb{F}_2$$
 s.t.

$$\delta \in \mathbb{F}_2^n : \Pr[f_k(x) = f_k(x+\delta)] = \frac{1}{2},$$

that is,  $f_k$  is a bent function.

Choose the simplest bent function known:

$$f_k(x,y) \coloneqq \langle x,y \rangle$$

# Implications

- Bent functions well studied
- Bent functions only exists for even n
- Instance not possible for every block length n

# **Conclusion/Questions**

Thank you for your attention!

# **BISON**

- A first instance of the WSN construction
- Good results for differential cryptanalysis

## **Open Problems**

- Construction for linear cryptanalysis
- Further analysis: division properties

BISON Round Function

# **BISON's round function**

For round keys  $k_i \in \mathbb{F}_2^n$  and  $w_i \in \mathbb{F}_2^{n-1}$  the round function computes  $R_{k_i,w_i}(x) \coloneqq x + f_{b(i)}(w_i + \Phi_{k_i}(x)) \cdot k_i.$ 

## where

•  $\Phi_{k_i}$  and  $f_{b(i)}$  are defined as  $\Phi_k(x) : \mathbb{F}_2^n \to \mathbb{F}_2^{n-1}$  $\Phi_k(x) := (x + x[i(k)] \cdot k)[j]_{\substack{1 \le j \le n \\ j \ne i(k)}}$ 

$$f_{b(i)}: \mathbb{F}_{2}^{\frac{n-1}{2}} \times \mathbb{F}_{2}^{\frac{n-1}{2}} \to \mathbb{F}_{2}$$
$$f_{b(i)}(x, y) \coloneqq \langle x, y \rangle + b(i),$$

• and b(i) is 0 if  $i \leq \frac{r}{2}$  and 1 else.

BISON Key Schedule

# BISON's key schedule

Given

■ primitive  $p_k$ ,  $p_w \in \mathbb{F}_2[x]$  with degrees n, n-1 and companion matrices  $C_k$ ,  $C_w$ .

• master key 
$$K = (k, w) \in \left(\mathbb{F}_2^n \times \mathbb{F}_2^{n-1}\right) \setminus \{0, 0\}$$

The *i*th round keys are computed by

$$\begin{split} \mathrm{KS}_i : \mathbb{F}_2^n \times \mathbb{F}_2^{n-1} \to \mathbb{F}_2^n \times \mathbb{F}_2^{n-1} \\ \mathrm{KS}_i(k, w) &\coloneqq (k_i, c_i + w_i) \end{split}$$

where

$$k_i = (C_k)^i k, \qquad c_i = (C_w)^{-i} e_1, \qquad w_i = (C_w)^i w.$$

# **Further Cryptanalysis**

# Linear Cryptanalysis

For  $r \ge n$  rounds, the correlation of any non-trivial linear trail for BISON is upper bounded by  $2^{-\frac{n+1}{2}}$ .

## **Invariant Attacks**

For  $r \ge n$  rounds, neither invariant subspaces nor nonlinear invariant attacks do exist for BISON.

## **Zero Correlation**

For r > 2n-2 rounds, BISON does not exhibit any zero correlation linear hulls.

## Impossible Differentials

For r > n rounds, there are no impossible differentials for BISON.
